

MB8117800A-60/-70

CMOS 2M X 8BIT FAST PAGE MODE DYNAMIC RAM

CMOS 2,097,152 x 8BIT Fast Page Mode Dynamic RAM

The Fujitsu MB8117800A is a fully decoded CMOS Dynamic RAM (DRAM) that contains 16,777,216 memory cells accessible in 8-bit increments. The MB8117800A features a "fast page" mode of operation whereby high-speed random access of up to 1,024-bits of data within the same row can be selected. The MB8117800A DRAM is ideally suited for mainframe, buffers, hand-held computers video imaging equipment, and other memory applications where very low power dissipation and high bandwidth are basic requirements of the design. Since the standby current of the MB8117800A is very small, the device can be used as a non-volatile memory in equipment that uses batteries for primary and/or auxiliary power.

The MB8117800A is fabricated using silicon gate CMOS and Fujitsu's advanced four-layer polysilicon and two-layer aluminum process. This process, coupled with advanced stacked capacitor memory cells, reduces the possibility of soft errors and extends the time interval between memory refreshes. Clock timing requirements for the MB8117800A are not critical and all inputs are TTL compatible.

PRODUCT LINE & FEATURES

Parameter		MB8117800A -60	MB8117800A -70
RAS Access Time		60ns max.	70ns max.
Random Cycle Time		110ns min.	130ns min.
Address Access Time		30ns max.	35ns max.
CAS Access Time		15ns max.	17ns max.
Fast Page Mode Cycle Time		40ns min.	45ns min.
Low Power Dissipation	Operating current	715 mW max.	660mW max.
	Standby current	11 mW max. (TTL level) / 5.5mW max. (CMOS level)	

- 2,097,152 words × 8 bit organization
- Silicon gate, CMOS, Advanced Capacitor Cell
- All input and output are TTL compatible
- 2048 refresh cycles every 32.8ms
- Self refresh function
- Early write or OE controlled write capability
- RAS only, CAS-before-RAS, or Hidden Refresh
- Fast page Mode, Read-Modify-Write capability
- On chip substrate bias generator for high performance

ABSOLUTE MAXIMUM RATINGS (see NOTE)

Parameter	Symbol	Value	Unit
Voltage at any pin relative to V _{SS}	V _{IN} , V _{OUT}	−0.5 to + 7.0	V
Voltage of V _{CC} supply relative to V _{SS}	V _{CC}	−0.5 to + 7.0	V
Power Dissipation	PD	1.0	W
Short Circuit Output Current	—	50	mA
Operating Temperature	T _{OP}	0 to 70	°C
Storage Temperature	T _{STG}	−55 to +125	°C

NOTE: Permanent device damage may occur if the above **Absolute Maximum Ratings** are exceeded. Functional operation should be restricted to the conditions as detailed in the operational sections of this data sheet. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Plastic SOJ Package
(LCC-28P-M07)

Plastic TSOP Packages
(FPT-28P-M14)

Package and Ordering Information

- 28-pin plastic (400mil) SOJ, order as MB8117800A-XXPJ
- 28-pin plastic (400mil) TSOP-II with normal bend leads, order as MB8117800A-XXPFTN

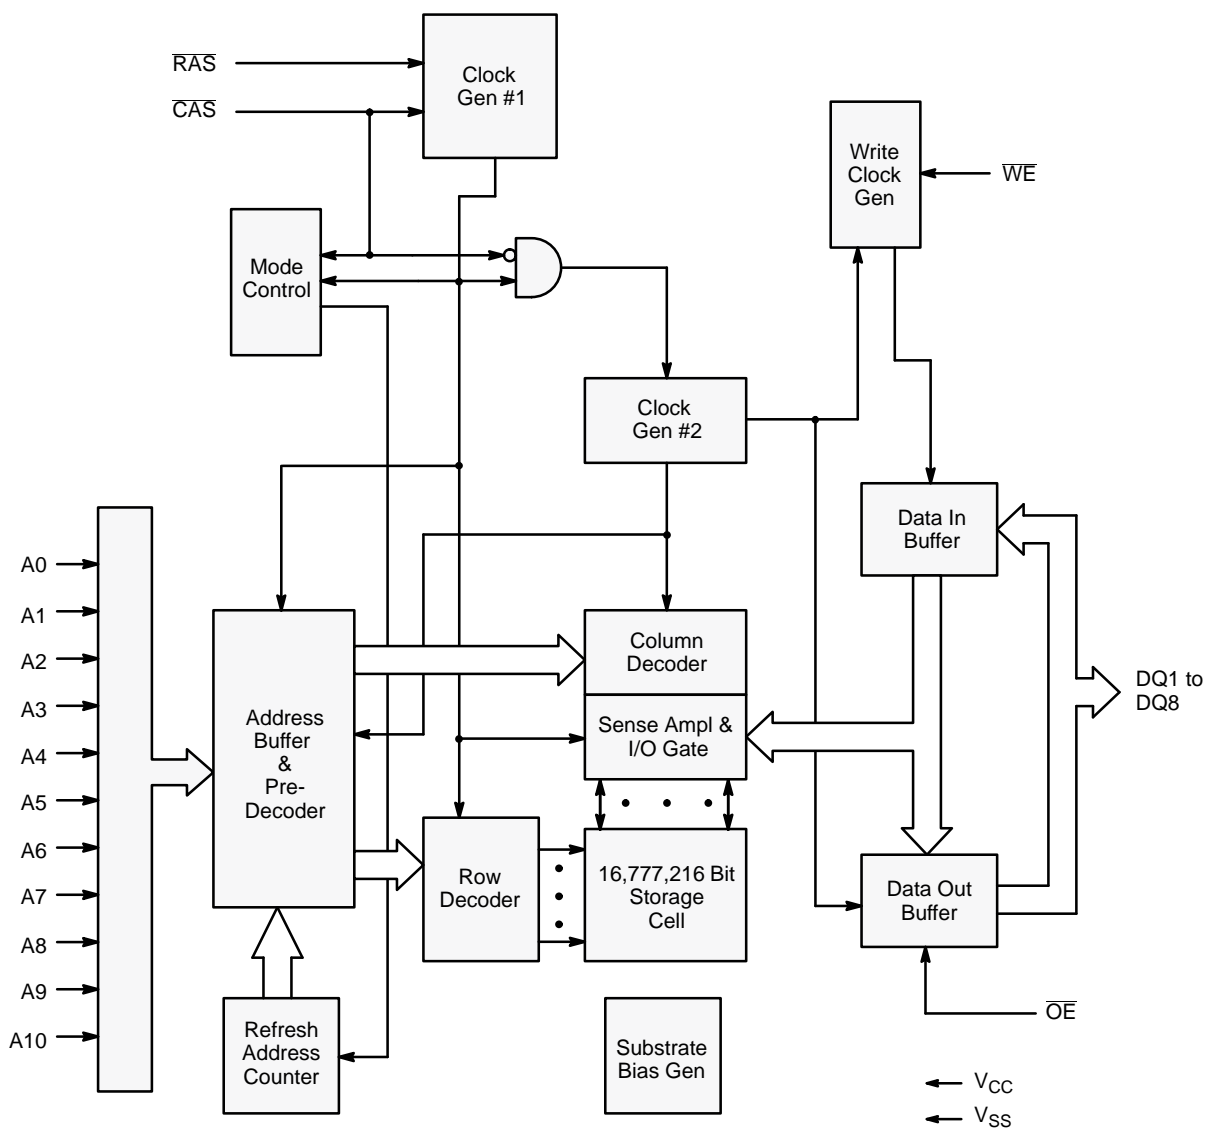

This device contains circuitry to protect the inputs against damage due to high static voltages or electric fields. However, it is advised that normal precautions be taken to avoid application of any voltage higher than maximum rated voltages to this high impedance circuit.

RECOMMENDED OPERATING CONDITIONS

Parameter	Notes	Symbol	Min	Typ	Max	Unit	Ambient Operating Temp.
Supply Voltage	1	V_{CC}	4.5	5.0	5.5	V	0°C to +70°C
		V_{SS}	0	0	0		
Input High Voltage, all inputs	1	V_{IH}	2.4	—	6.5	V	
Input High Voltage, all inputs/outputs*	1	V_{IL}	−0.3	—	0.8	V	

* : Undershoots of up to −2.0 volts with a pulse width not exceeding 20ns are acceptable.

FUNCTIONAL OPERATION

ADDRESS INPUTS

Twenty-one input bits are required to decode any eight of 16,777,216 cell addresses in the memory matrix. Since only eleven address bits (A0 to A10) are available, the row and column inputs are separately strobed by \overline{RAS} and \overline{CAS} as shown in Figure 1. First, eleven row address bits are input on pins A0–through–A10 and latched with the row address strobe (\overline{RAS}) then, ten column address bits are input and latched with the column address strobe (\overline{CAS}). Both row and column addresses must be stable on or before the falling edge of \overline{RAS} and \overline{CAS} , respectively. The address latches are of the flow-through type; thus, address information appearing after t_{RAH} (min) + t_T is automatically treated as the column address.

WRITE ENABLE

The read or write mode is determined by the logic state of \overline{WE} . When \overline{WE} is active Low, a write cycle is initiated; when \overline{WE} is High, a read cycle is selected. During the read mode, input data is ignored.

DATA INPUT

Input data is written into memory in either of three basic ways—an early write cycle, an \overline{OE} (delayed) write cycle, and a read-modify-write cycle. The falling edge of \overline{WE} or \overline{CAS} , whichever is later, serves as the input data-latch strobe. In an early write cycle, the input data (DQ1–DQ8) is strobed by \overline{CAS} and the setup/hold times are referenced to \overline{CAS} because \overline{WE} goes Low before \overline{CAS} . In a delayed write or a read-modify-write cycle, \overline{WE} goes Low after \overline{CAS} ; thus, input data is strobed by \overline{WE} and all setup/hold times are referenced to the write-enable signal.

DATA OUTPUT

The three-state buffers are TTL compatible with a fanout of two TTL loads. Polarity of the output data is identical to that of the input; the output buffers remain in the high-impedance state until the column address strobe goes Low. When a read or read-modify-write cycle is executed, valid outputs are obtained under the following conditions:

- t_{RAC} : from the falling edge of \overline{RAS} when t_{RCD} (max) is satisfied.
- t_{CAC} : from the falling edge of \overline{CAS} when t_{RCD} is greater than t_{RCD} (max).
- t_{AA} : from column address input when t_{RAD} is greater than t_{RAD} (max).
- t_{OEA} : from the falling edge of \overline{OE} when \overline{OE} is brought Low after t_{RAC} , t_{CAC} , or t_{AA} .

The data remains valid until either \overline{CAS} or \overline{OE} returns to a High logic level. When an early write is executed, the output buffers remain in a high-impedance state during the entire cycle.

FAST PAGE MODE OF OPERATION

The fast page mode of operation provides faster memory access and lower power dissipation. The fast page mode is implemented by keeping the same row address and strobing in successive column addresses. To satisfy these conditions, \overline{RAS} is held Low for all contiguous memory cycles in which row addresses are common. For each fast page of memory, any of 1,024 x 8-bits can be accessed and, when multiple MB8117800As are used, \overline{CAS} is decoded to select the desired memory fast page. Fast page mode operations need not be addressed sequentially and combinations of read, write, and/or read-modify-write cycles are permitted.

– PRELIMINARY –

Edition 2.0

MB8117800A-60
MB8117800A-70

Notes:

1. Referenced to V_{SS} .
2. I_{CC} depends on the output load conditions and cycle rates; The specified values are obtained with the output open. I_{CC} depends on the number of address change as $\overline{RAS} = V_{IL}$, $\overline{CAS} = V_{IH}$ and $V_{IL} > -0.3V$.
 I_{CC1} , I_{CC3} , I_{CC4} and I_{CC5} are specified at one time of address change during $\overline{RAS} = V_{IL}$ and $\overline{CAS} = V_{IH}$. I_{CC2} is specified during $\overline{RAS} = V_{IH}$ and $V_{IL} > -0.3V$.
3. An initial pause ($\overline{RAS} = \overline{CAS} = V_{IH}$) of 200 μs is required after power-up followed by any eight \overline{RAS} -only cycles before proper device operation is achieved. In case of using internal refresh counter, a minimum of eight \overline{CAS} -before- \overline{RAS} initialization cycles instead of 8 \overline{RAS} cycles are required.
4. AC characteristics assume $t_T = 5ns$.
5. V_{IH} (min) and V_{IL} (max) are reference levels for measuring timing of input signals. Also transition times are measured between V_{IH} (min) and V_{IL} (max).
6. Assumes that $t_{RCD} \leq t_{RCD}(\max)$, $t_{RAD} \leq t_{RAD}(\max)$. If t_{RCD} is greater than the maximum recommended value shown in this table, t_{RAC} will be increased by the amount that t_{RCD} exceeds the value shown. Refer to Fig.2 and 3.
7. If $t_{RCD} \geq t_{RCD}(\max)$, $t_{RAD} \geq t_{RAD}(\max)$, and $t_{ASC} \geq t_{AA} - t_{CAC} - t_T$, access time is t_{CAC} .
8. If $t_{RAD} \geq t_{RAD}(\max)$ and $t_{ASC} \leq t_{AA} - t_{CAC} - t_T$, access time is t_{AA} .
9. Measured with a load equivalent to two TTL loads and 100pF.
10. t_{OFF} and t_{OEZ} is specified that output buffer change to high impedance state.
11. Operation within the $t_{RCD}(\max)$ limit ensures that $t_{RAC}(\max)$ can be met. $t_{RCD}(\max)$ is specified as a reference point only; if t_{RCD} is greater than the specified $t_{RCD}(\max)$ limit, access time is controlled exclusively by t_{CAC} or t_{AA} .
12. $t_{RCD}(\min) = t_{RAH}(\min) + 2t_T + t_{ASC}(\min)$.
13. Operation within the $t_{RAD}(\max)$ limit ensures that $t_{RAC}(\max)$ can be met. $t_{RAD}(\max)$ is specified as a reference point only; if t_{RAD} is greater than the specified $t_{RAD}(\max)$ limit, access time is controlled exclusively by t_{CAC} or t_{AA} .
14. Either t_{RRH} or t_{RCH} must be satisfied for a read cycle.
15. t_{WCS} is specified as a reference point only. If $t_{WCS} \geq t_{WCS}(\min)$ the data output pin will remain High-Z state through entire cycle.
16. Assumes that $t_{WCS} < t_{WCS}(\min)$.
17. Either t_{DZC} or t_{DZO} must be satisfied.
18. t_{CPA} is access time from the selection of a new column address (that is caused by changing \overline{CAS} from "L" to "H"). Therefore, if t_{CP} is long, t_{CPA} is longer than $t_{CPA}(\max)$.
19. Assumes that \overline{CAS} -before- \overline{RAS} refresh.
20. t_{WCS} , t_{CWD} , t_{RWD} and t_{AWD} are not restrictive operating parameters. They are included in the data sheet as an electrical characteristic only. If $t_{WCS} > t_{WCS}(\min)$, the cycle is an early write cycle and D_{OUT} pin will maintain high impedance state throughout the entire cycle. If $t_{CWD} > t_{CWD}(\min)$, $t_{RWD} > t_{RWD}(\min)$, and $t_{AWD} > t_{AWD}(\min)$, the cycle is a read-modify-write cycle and data from the selected cell will appear at the D_{OUT} pin. If neither of the above conditions is satisfied, the cycle is a delayed write cycle and invalid data will appear the D_{OUT} pin, and write operation can be executed by satisfying t_{RWL} , t_{CWL} , and t_{RAL} specifications.

Hidden Refresh Cycle	H→L	L	H→X	L	–	–	–	Valid	Yes	Previous data is kept.

X; "H" or "L"

*; It is impossible in Fast Page Mode.

MB8117800A-60
MB8117800A-70

Fig. 5 – READ CYCLE

"H" or "L"

DESCRIPTION

To implement a read operation, a valid address is latched in by the \overline{RAS} and \overline{CAS} address strobes and with \overline{WE} set to a High level and \overline{OE} set to a low level, the output is valid once the memory access time has elapsed. The access time is determined by $\overline{RAS}(t_{RAC})$, $\overline{CAS}(t_{CAC})$, $\overline{OE}(t_{OEA})$ or column addresses (t_{AA}) under the following conditions:

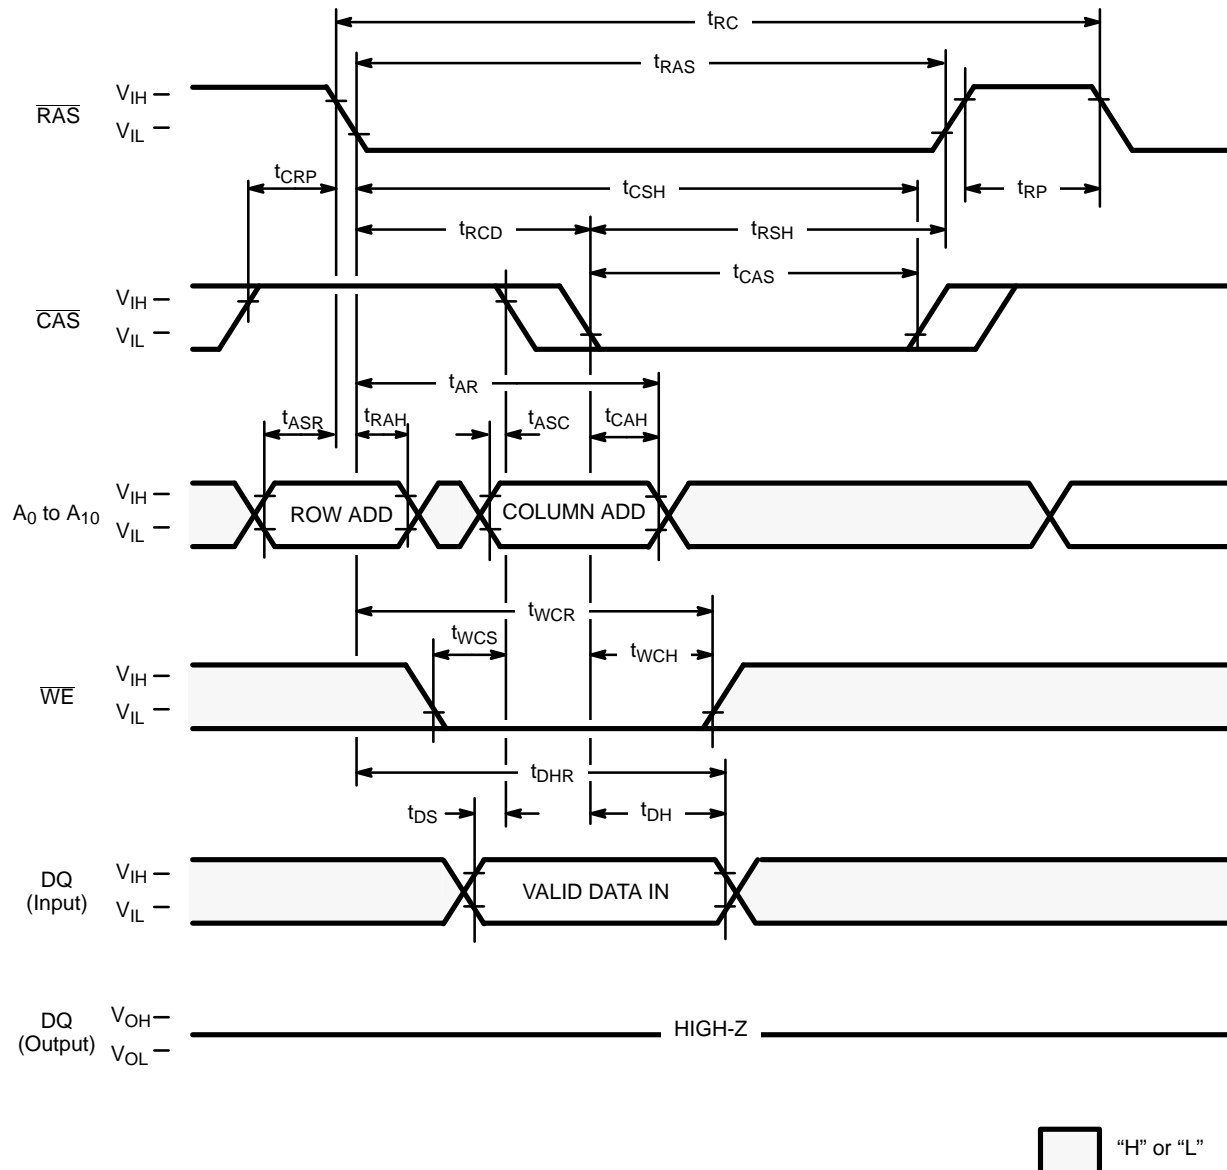

If $t_{RCD} > t_{RCD}(\max)$, access time = t_{CAC} .

If $t_{RAD} > t_{RAD}(\max)$, access time = t_{AA} .

If \overline{OE} is brought Low after t_{RAC} , t_{CAC} , or t_{AA} (whichever occurs later), access time = t_{OEA} .

However, if either \overline{CAS} or \overline{OE} goes High, the output returns to a high-impedance state after t_{OH} is satisfied.

Fig. 6 – EARLY WRITE CYCLE (\overline{OE} = "H" or "L")

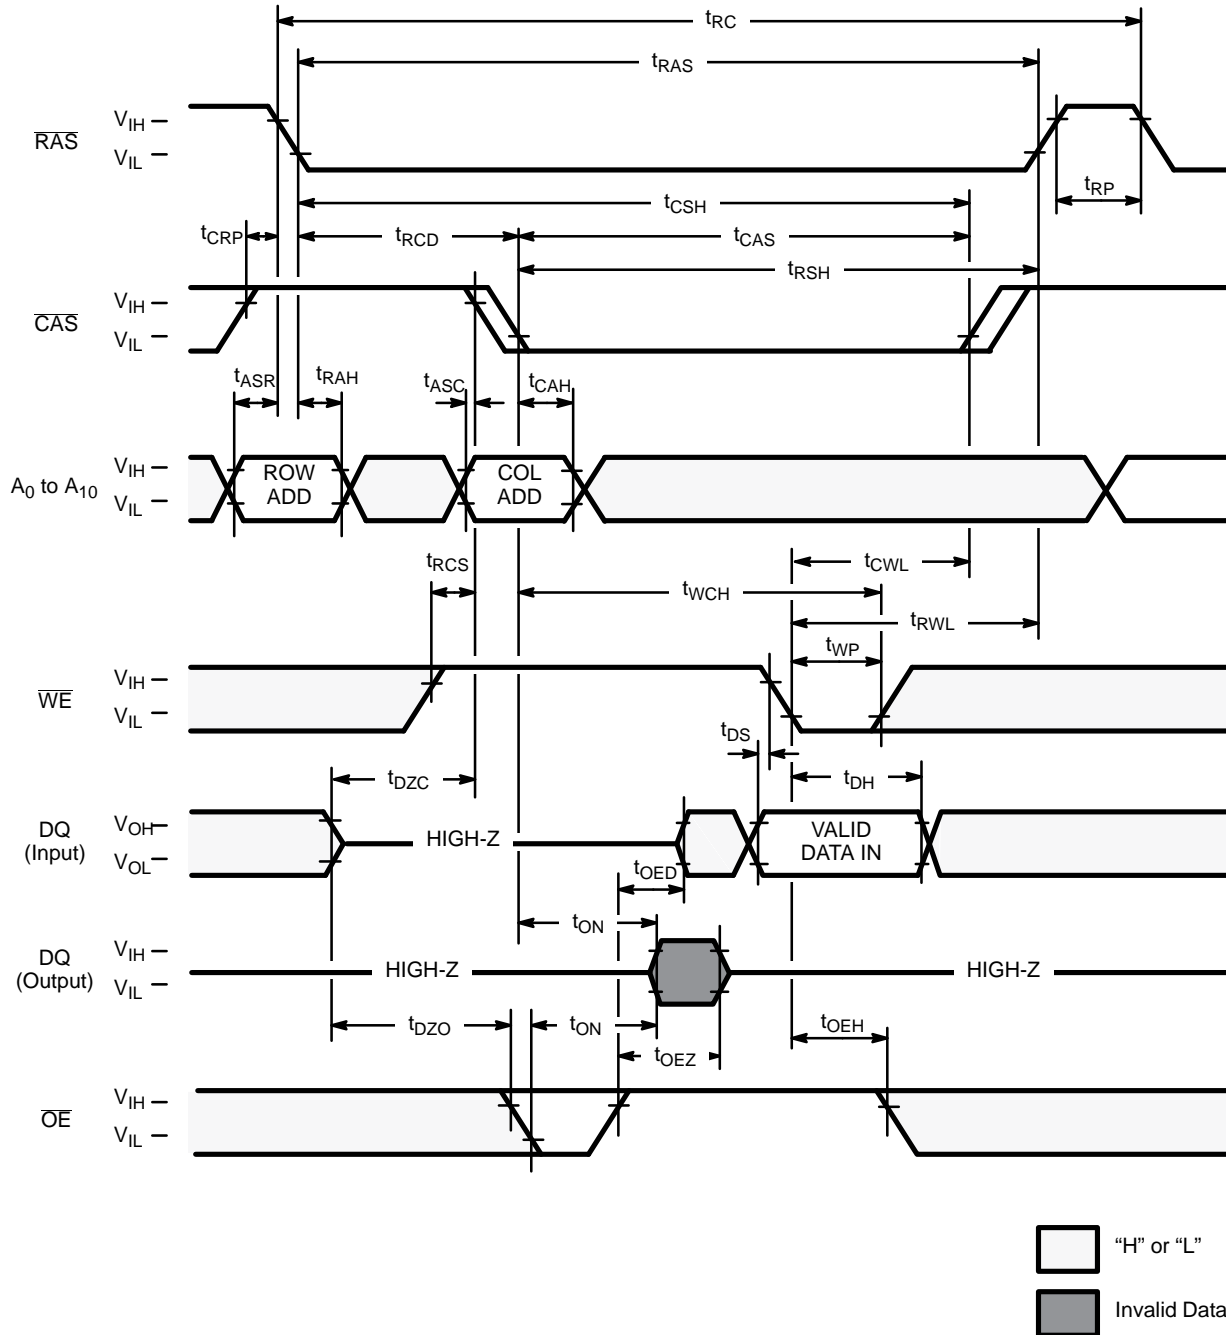

DESCRIPTION

A write cycle is similar to a read cycle except \overline{WE} is set to a Low state and \overline{OE} is an "H" or "L" signal. A write cycle can be implemented in either of three ways – early write, delayed write, or read-modify-write. During all write cycles, timing parameters t_{RWL} , t_{CWL} and t_{RAL} must be satisfied. In the early write cycle shown above t_{WCS} satisfied, data on the DQ pin is latched with the falling edge of \overline{CAS} and written into memory.

MB8117800A-60
MB8117800A-70

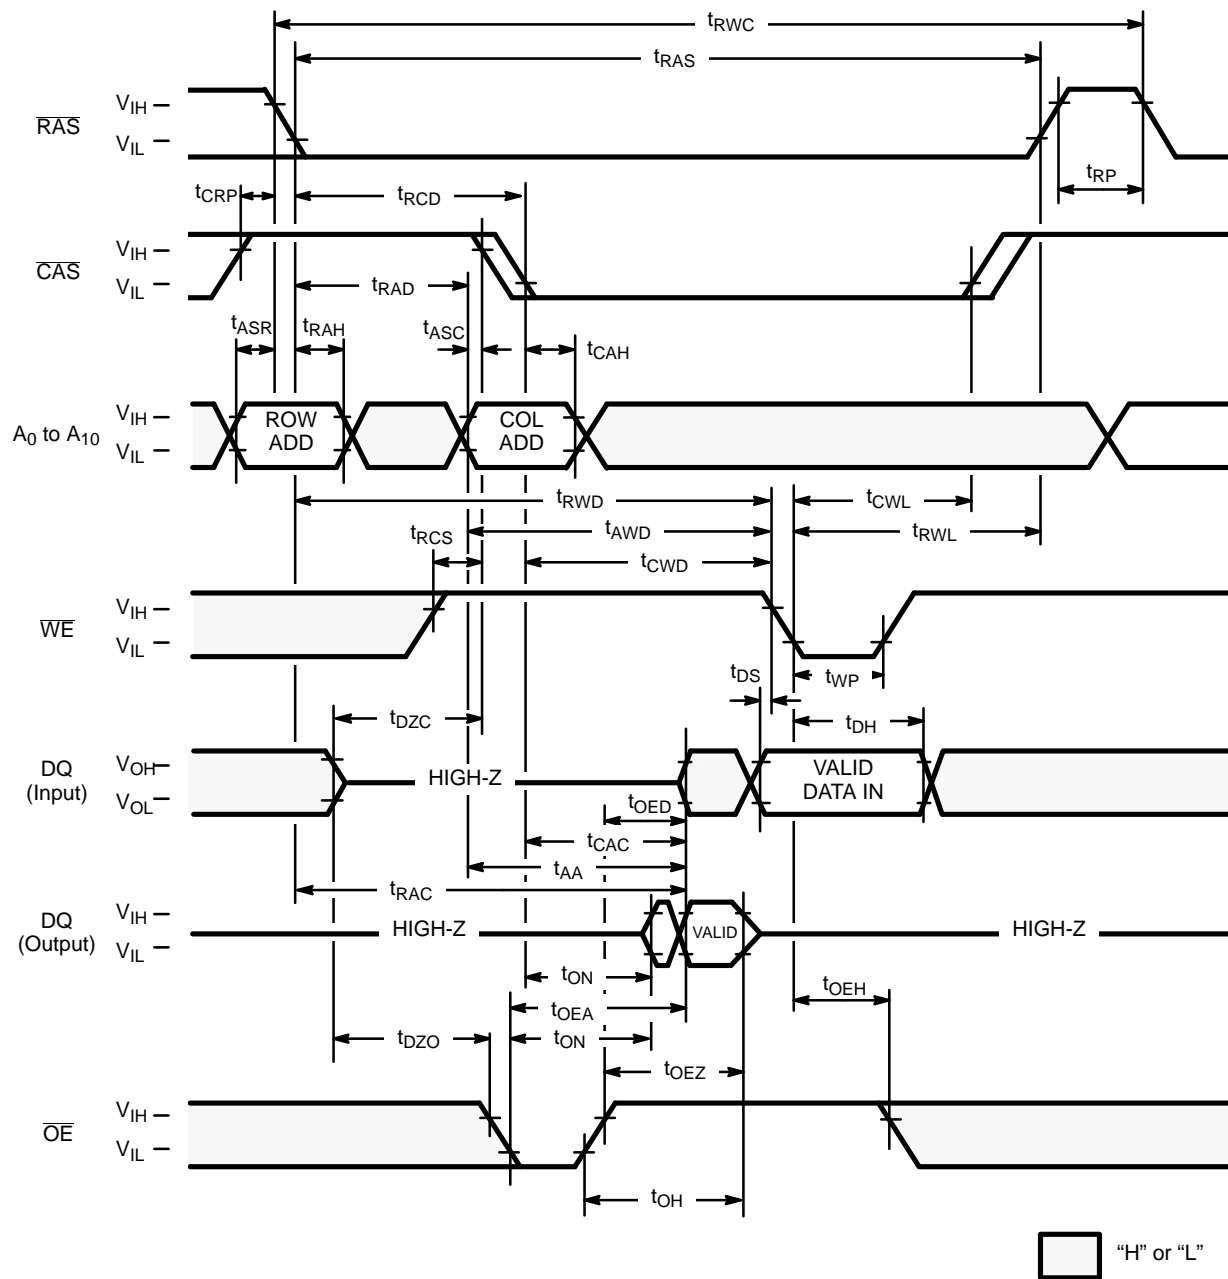

Fig. 7 – DELAYED WRITE CYCLE

DESCRIPTION

In the delayed write cycle, t_{WCS} is not satisfied; thus, the data on the DQ pins is latched with the falling edge of \overline{WE} and written into memory. The Output Enable (\overline{OE}) signal must be changed from Low to High before \overline{WE} goes Low ($t_{OED} + t_{DS}$).

Fig. 8 – READ-MODIFY-WRITE-CYCLE

DESCRIPTION

The read-modify-write cycle is executed by changing \overline{WE} from High to Low after the data appears on the DQ pins. In the read-modify-write cycle, \overline{OE} must be changed from Low to High after the memory access time.

Edition 2.0

MB8117800A-60
MB8117800A-70

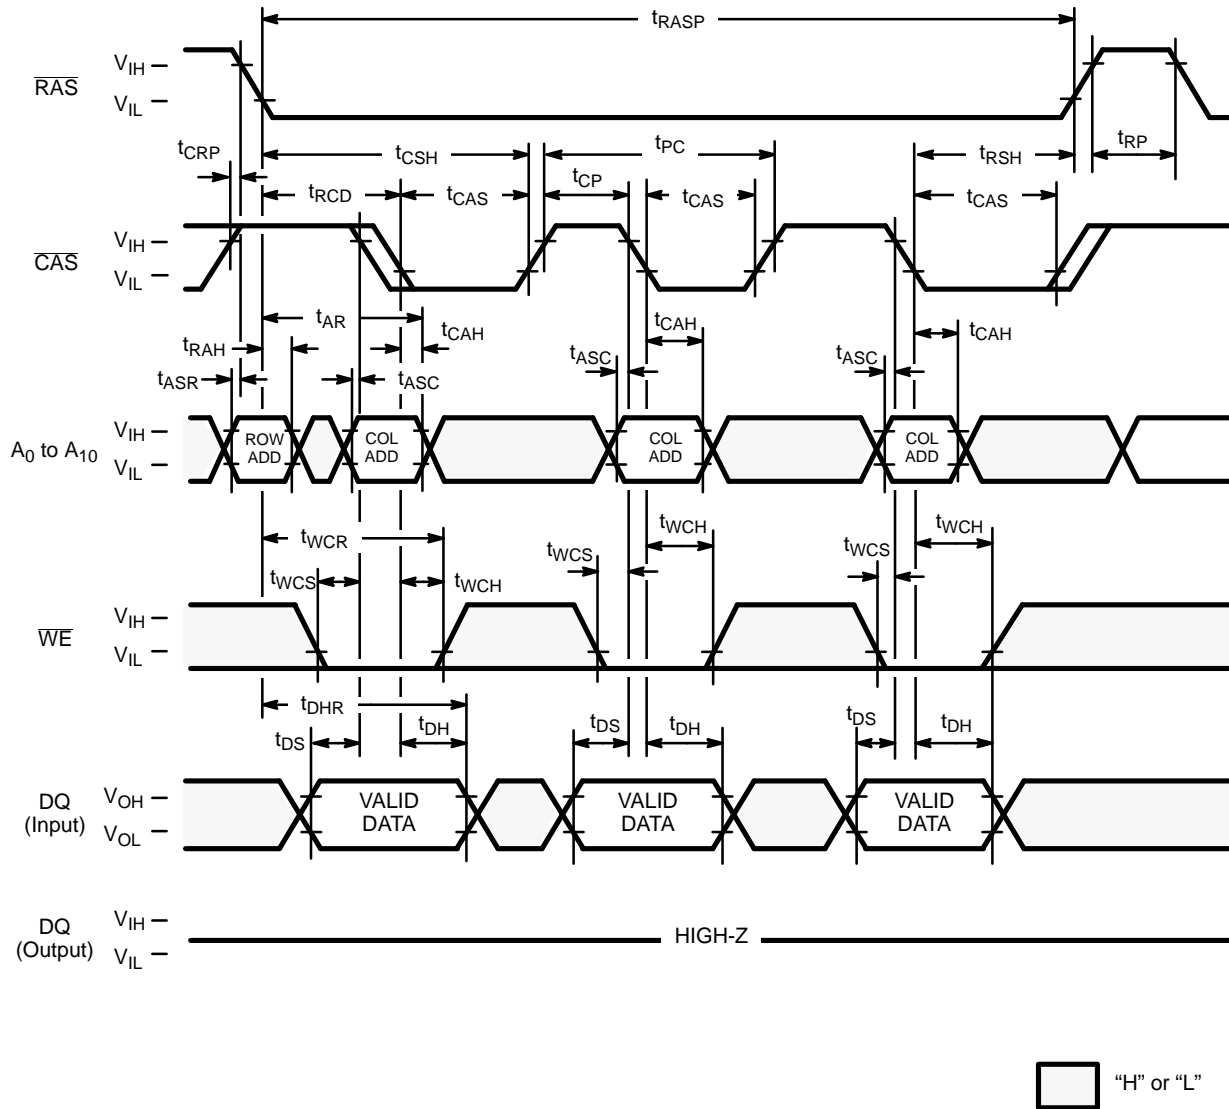

Fig. 9 – FAST PAGE MODE READ CYCLE

DESCRIPTION

The fast page mode of operation permits faster successive memory operations at multiple column locations of the same row address. This operation is performed by strobing in the row address and maintaining $\overline{\text{RAS}}$ at a Low level and $\overline{\text{WE}}$ at a High level during all successive memory cycles in which the row address is latched. The address time is determined by t_{CAC} , t_{AA} , t_{CPA} , or t_{OEA} , whichever one is the lastest in occuring.

Fig. 10 – FAST PAGE MODE EARLY WRITE CYCLE (\overline{OE} = “H” or “L”)

DESCRIPTION

The fast page mode early write cycle is executed in the same manner as the fast page mode read cycle except the states of \overline{WE} and \overline{OE} are reversed. Data appearing on the DQ pins is latched on the falling edge of \overline{CAS} and written into memory. During the fast page mode early write cycle, including the delayed (\overline{OE}) write and read-modify-write cycles, t_{CWL} must be satisfied.

MB8117800A-60
MB8117800A-70

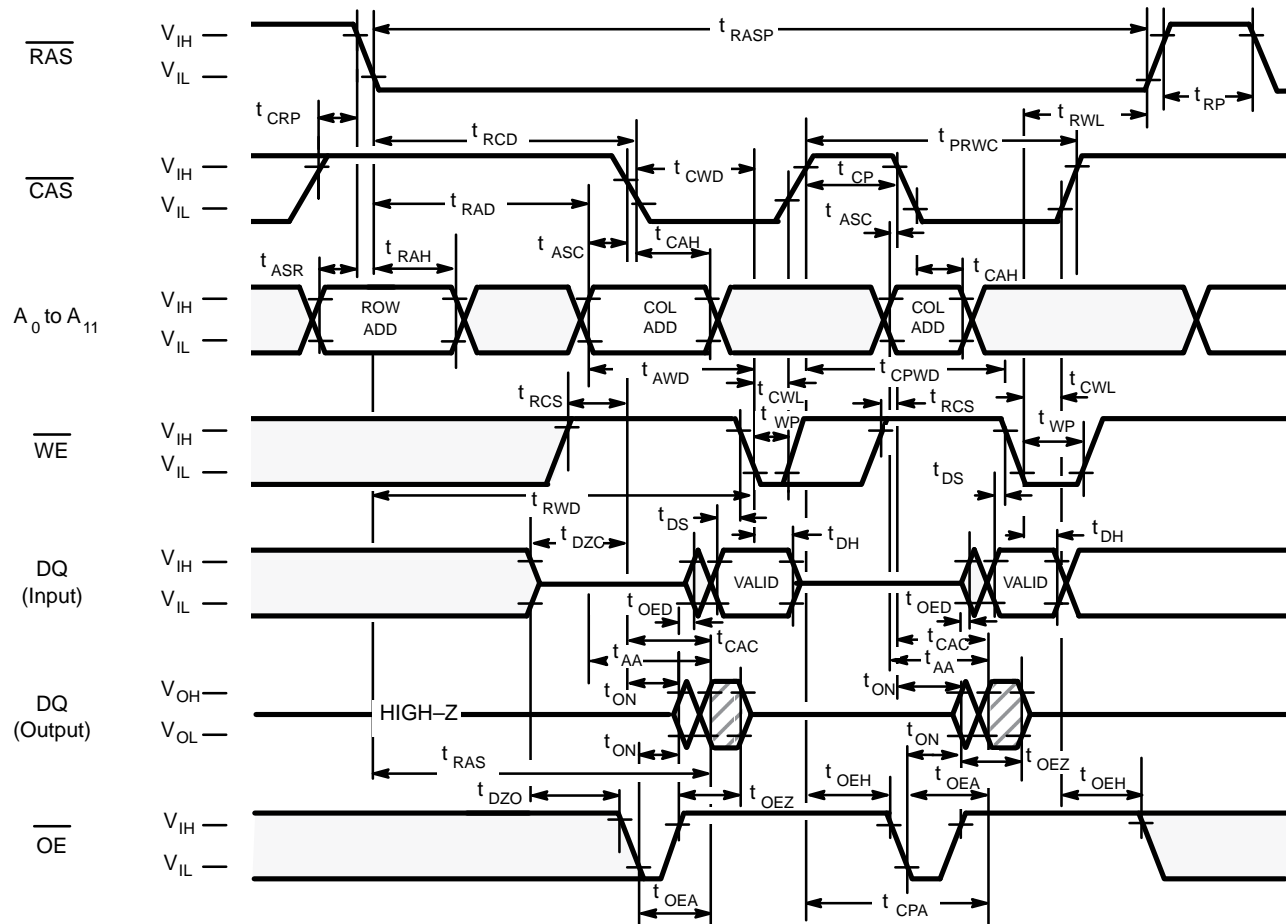

Fig. 11 – FAST PAGE MODE DELAYED WRITE CYCLE

DESCRIPTION

The fast page mode delayed write cycle is executed in the same manner as the fast page mode early write cycle except for the states of \overline{WE} and \overline{OE} . Input data on the DQ pins are latched on the falling edge of \overline{WE} and written into memory. In the fast page mode delayed write cycle, \overline{OE} must be changed from Low to High before \overline{WE} goes Low ($t_{OED} + t_r + t_{DS}$).

Fig. 12 Fast Page Mode Read Modify Write Cycle

DESCRIPTION

During the fast page mode of operation, the read-modify-write cycle can be executed by switching \overline{WE} from High to Low after input data appears at the DQ pins during a normal cycle.

MB8117800A-60
MB8117800A-70

Fig. 13 – RAS-ONLY REFRESH ($\overline{WE} = \overline{OE} = \text{"H" or "L"}$)

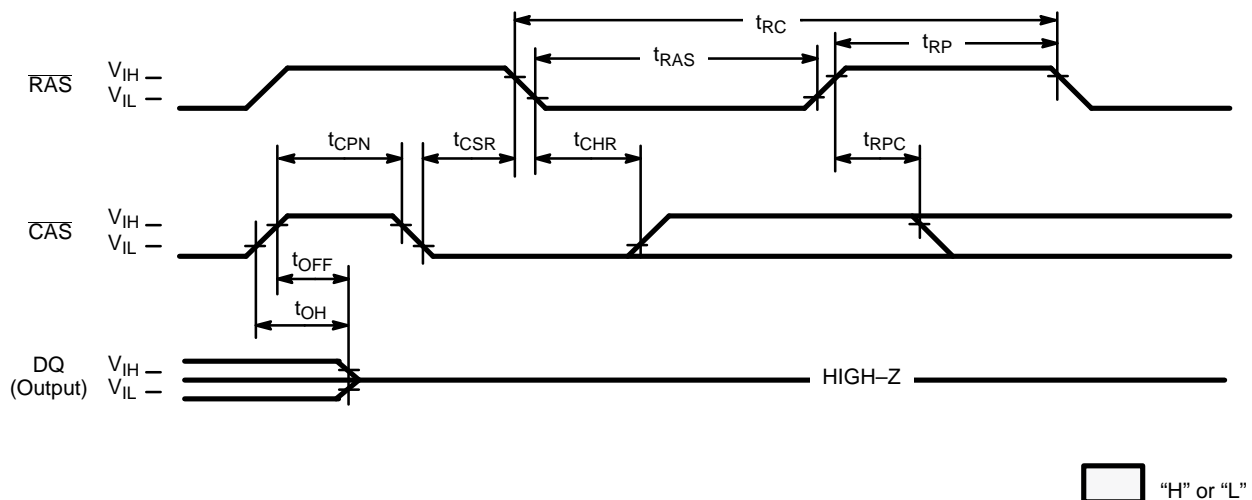

DESCRIPTION

Refresh of RAM memory cells is accomplished by performing a read, a write, or a read-modify-write cycle at each of 2048 row addresses every 32.8-milliseconds. Three refresh modes are available: RAS-only refresh, \overline{CAS} -before-RAS refresh, and hidden refresh.

\overline{RAS} -only refresh is performed by keeping \overline{RAS} Low and \overline{CAS} High throughout the cycle; the row address to be refreshed is latched on the falling edge of \overline{RAS} . During \overline{RAS} -only refresh, D_{OUT} pins are kept in a high-impedance state.

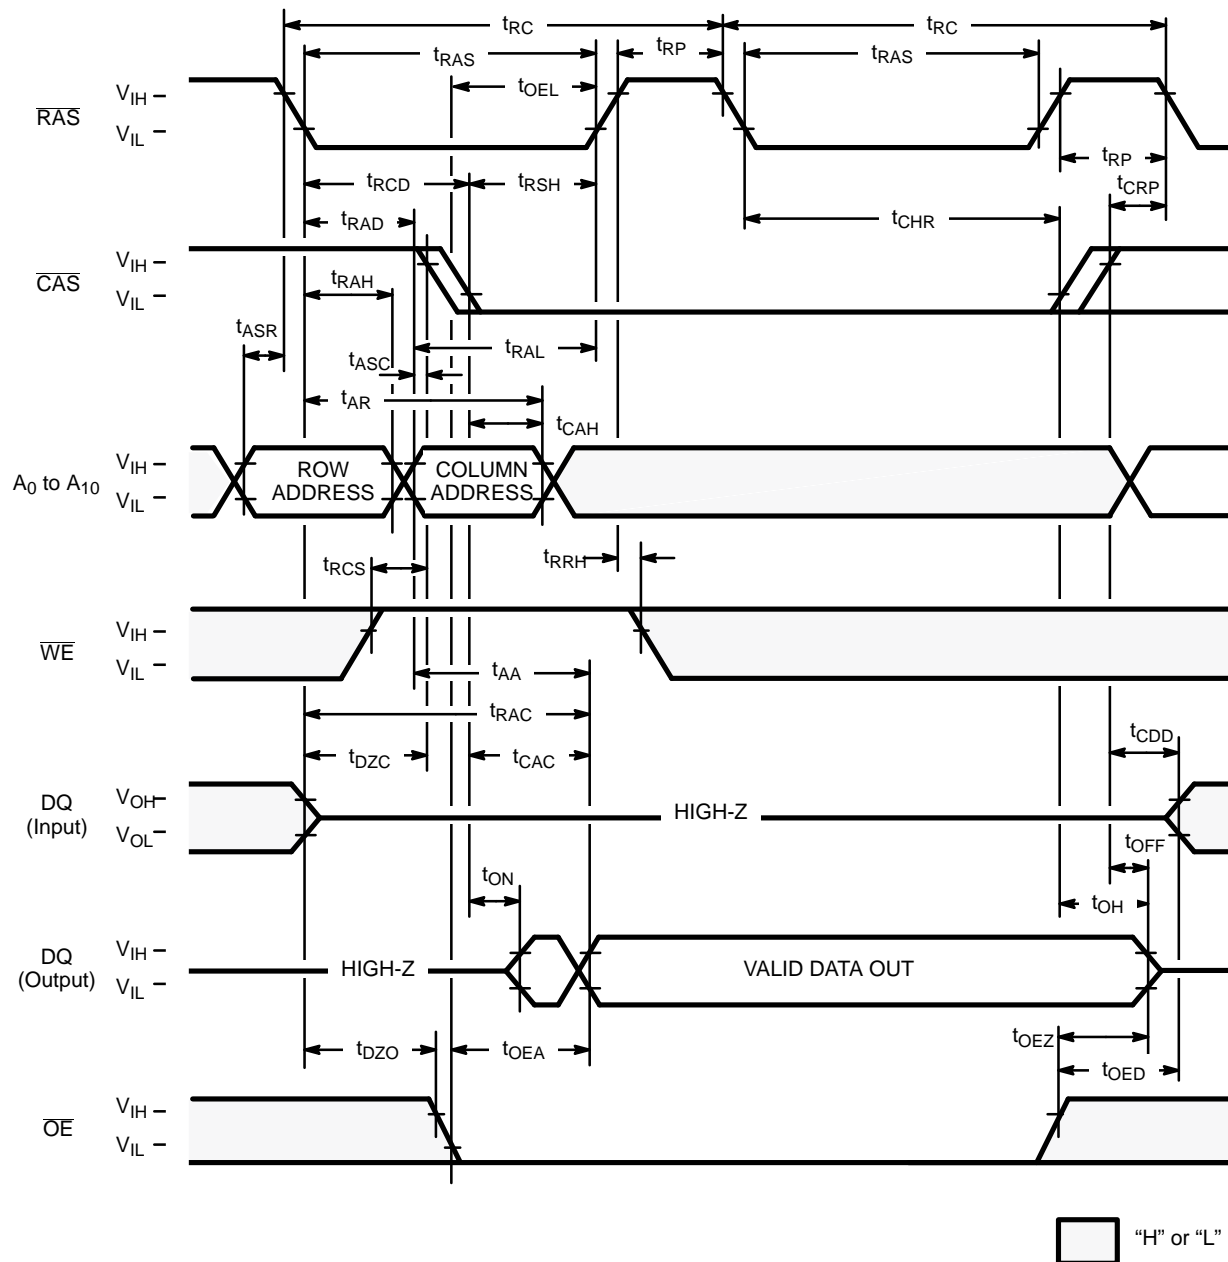

Fig. 14 – \overline{CAS} -BEFORE- \overline{RAS} REFRESH (ADDRESSES = $\overline{WE} = \overline{OE} = \text{"H" or "L"}$)

DESCRIPTION

\overline{CAS} -before- \overline{RAS} refresh is an on-chip refresh capability that eliminates the need for external refresh addresses. If \overline{CAS} is held Low for the specified setup time (t_{CSR}) before \overline{RAS} goes Low, the on-chip refresh control clock generators and refresh address counter are enabled. An internal refresh operation automatically occurs and the refresh address counter is internally incremented in preparation for the next \overline{CAS} -before- \overline{RAS} refresh operation.

Fig. 15 – HIDDEN REFRESH CYCLE

DESCRIPTION

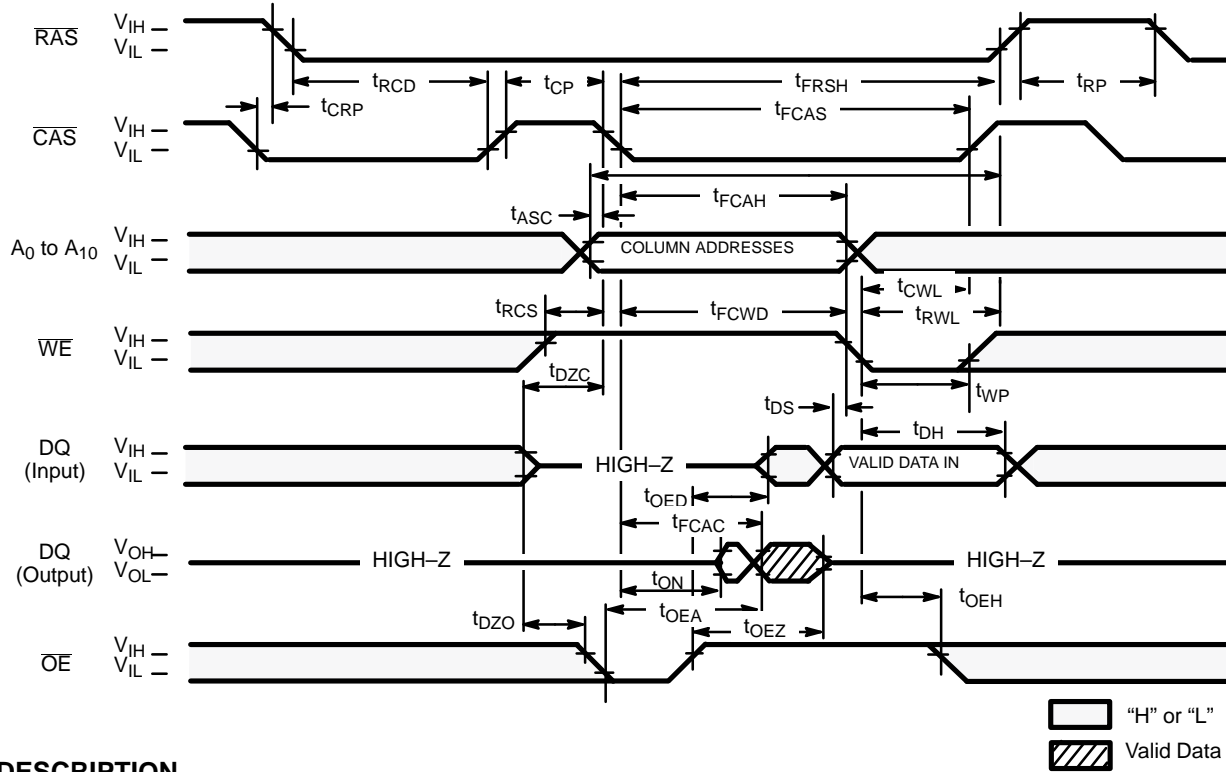

A hidden refresh cycle may be performed while maintaining the latest valid data at the output by extending the active time of \overline{CAS} and cycling RAS. The refresh row address is provided by the on-chip refresh address counter. This eliminates the need for the external row address that is required by DRAMs that do not have \overline{CAS} -before-RAS refresh capability.

Fig. 16 – $\overline{\text{CAS}}$ -BEFORE- $\overline{\text{RAS}}$ REFRESH COUNTER TEST CYCLE

DESCRIPTION

A special timing sequence using the $\overline{\text{CAS}}$ -before- $\overline{\text{RAS}}$ refresh counter test cycle provides a convenient method to verify the function of $\overline{\text{CAS}}$ -before- $\overline{\text{RAS}}$ refresh circuitry. If, a $\overline{\text{CAS}}$ -before- $\overline{\text{RAS}}$ refresh cycle $\overline{\text{CAS}}$ makes a transition from High to Low while $\overline{\text{RAS}}$ is held Low, read and write operations are enabled as shown above. Row and column addresses are defined as follows:

Row Address: Bits A0 through A10 are defined by the on-chip refresh counter.

Column Address: Bits A0 through A9 are defined by latching levels on A0–A9 at the second falling edge of $\overline{\text{CAS}}$.

The $\overline{\text{CAS}}$ -before- $\overline{\text{RAS}}$ Counter Test procedure is as follows;

- 1) Initialize the internal refresh address counter by using 8 $\overline{\text{RAS}}$ only refresh cycles.
- 2) Use the same column address throughout the test.
- 3) Write "0" to all 2048 row addresses at the same column address by using normal write cycles.
- 4) Read "0" written in procedure 3) and check; simultaneously write "1" to the same addresses by using $\overline{\text{CAS}}$ -before- $\overline{\text{RAS}}$ refresh counter test (read-modify-write cycles). Repeat this procedure 2048 times with addresses generated by the internal refresh address counter.
- 5) Read and check data written in procedure 4) by using normal read cycle for all 2048 memory locations.
- 6) Reverse test data and repeat procedures 3), 4), and 5).

(At recommended operating conditions unless otherwise noted.)

No.	Parameter	Symbol	MB8117800A-60		MB8117800A-70		Unit
			Min	Max	Min	Max	
90	Access Time from $\overline{\text{CAS}}$	t_{FCAC}	—	50	—	55	ns
91	Column Address Hold Time	t_{FCAH}	35	—	35	—	ns
92	$\overline{\text{CAS}}$ to $\overline{\text{WE}}$ Delay Time	t_{FCWD}	70	—	77	—	ns
93	$\overline{\text{CAS}}$ Pulse width	t_{FCAS}	90	—	99	—	ns
94	$\overline{\text{RAS}}$ Hold Time	t_{FRSH}	90	—	99	—	ns

Note. Assumes that $\overline{\text{CAS}}$ -before- $\overline{\text{RAS}}$ refresh counter test cycle only.

Fig. 17 – SELF REFRESH CYCLE (A0–A10 = \overline{WE} = \overline{OE} = "H" or "L")

(At recommended operating conditions unless otherwise noted.)

No.	Parameter	Symbol	MB8117800A-60		MB8117800A-70		Unit
			Min	Max	Min	Max	
100	\overline{RAS} Pulse Width	t_{RAS}	100	—	100	—	μs
101	\overline{RAS} Precharge Time	t_{RPS}	110	—	125	—	ns
102	\overline{CAS} Hold Time	t_{CHS}	–50	—	–50	—	ns

Note . Assumes self refresh cycle only

DESCRIPTION

The self refresh cycle provides a refresh operation without external clock and external Address. Self refresh control circuit on chip is operated in the self refresh cycle and refresh operation can be automatically executed using internal refresh address counter and timing generator. If \overline{CAS} goes to "L" before \overline{RAS} goes to "L" (CBR) and the condition of \overline{CAS} "L" and \overline{RAS} "L" is kept for term of t_{RAS} (more than 100 μs), the device can enter the self refresh cycle. Following that, refresh operation is automatically executed at fixed intervals using internal refresh address counter during " \overline{RAS} =L" and " \overline{CAS} =L".

Exit from self refresh cycle is performed by toggling \overline{RAS} and \overline{CAS} to "H" with specified t_{CHS} min.. In this time, \overline{RAS} must be kept "H" with specified t_{RPS} min..

Using self refresh mode, data can be retained without external \overline{CAS} signal during system is in standby.

Restriction for Self Refresh operation ;

For self refresh operation, the notice below must be considered.

- 1) In the case that distributed CBR refresh are operated between read/write cycles
Self refresh cycles can be executed without special rule if 2,048 cycles of distributed CBR refresh are executed within t_{REF} max..
- 2) In the case that burst CBR refresh or distributed/burst /RAS only refresh are operated between read/write cycles
2,048 times of burst CBR refresh or 2,048 times of burst /RAS only refresh must be executed before and after Self refresh cycles.

* read/write operation can be performed non refresh time within t_{NS} or t_{SN}
