DESCRIPTION

The GAL22V10/883 is a high performance E²CMOS programmable logic device processed in full compliance to MIL-STD-883. This military grade device combines a high performance CMOS process with Electrically Erasable (E²) floating gate technology to provide the highest speed performance available of any military qualified 22V10 device. CMOS circuitry allows the GAL22V10 to consume much less power when compared to bipolar 22V10 devices. E² technology offers high speed (<100ms) erase times, providing the ability to reprogram or reconfigure the device quickly and efficiently.

The generic architecture provides maximum design flexibility by allowing the Output Logic Macrocell (OLMC) to be configured by the user. The GAL22V10 is fully function/fuse map/parametric compatible with standard bipolar and CMOS 22V10 devices.

Unique test circuitry and reprogrammable cells allow complete AC, DC, and functional testing during manufacture. As a result, Lattice Semiconductor guarantees 100% field programmability and functionality of all GAL products. In addition, 100 erase/write cycles and data retention in excess of 20 years are guaranteed.

f_{max} DESCRIPTIONS

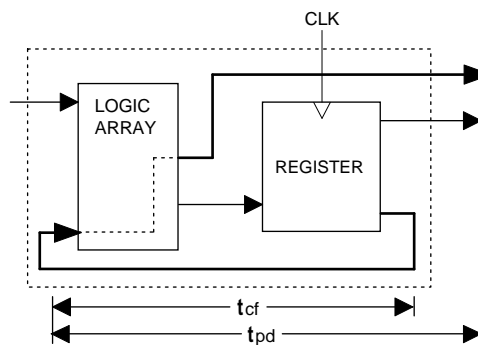

f_{max} with External Feedback 1/(t_{su}+t_{co})

Note: f_{max} with external feedback is calculated from measured t_{su} and t_{co}.

f_{max} with No Feedback

Note: f_{max} with no feedback may be less than 1/(t_{wh} + t_{wl}). This is to allow for a clock duty cycle of other than 50%.

f_{max} with Internal Feedback 1/(t_{su}+t_{cf})

Note: t_{cf} is a calculated value, derived by subtracting t_{su} from the period of f_{max} w/internal feedback (t_{cf} = 1/f_{max} - t_{su}). The value of t_{cf} is used primarily when calculating the delay from clocking a register to a combinatorial output (through registered feedback), as shown above. For example, the timing from clock to a combinatorial output is equal to t_{cf} + t_{pd}.
